Anypothalamic tetradecapeptide - pig
C.Species: Sus scrofa domestica (domestic pig)
C.Species: Sus scrofa domestica (domestic pig)
C.Accession: A01419
R.Schlesinger, D.H.; Niall, H.D.; Linthicum, G.L.; Dupont, A.; Schally, A.V. submitted to the Atlas, November 1976
A.; Reference number: A01419
A.; Recession: A01419
A.; Molecule type: protein
A.; Residues: 1-14 «SCH»
C.Superfamily: hypothalamic tetradecapeptide
C.; Keywords: amidated carboxyl end, hypothalamus
F;14/Modified site: amidated carboxyl end (Tyr) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
Regul. Pept. 65:185-196(1996).
-!- FUNCTION: Myoactive peptide. Increases the amplitude and frequency of spontaneous contractions and tonus of hindgut muscle.
-!- SUBCELULIAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Midgut.
-!- SIMILARITY: SOME SIMILARITY TO TACHYKININS.
-!- SIMILARITY: SOME AMIGATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

 Clostridium pasteurianum.
Bacteria, Firmicutes, Clostridia, Clostridiales, Clostridiaceae,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ramachandra M., Seetharam R., Emptage M.H., Sariaslani F.S.;
"Purification and characterization of a soybean flour-inducible ferredoxin reductase of Streptomyces griseus.";
J. Bacteriol. 173:7106-7112(1991).
-! FUNCTION: COUPLE ELECTRON TRANSFER FROM NADH TO CYTOCHROME P450(SOY) IN THE PRESENCE OF FERREDOXIN.
-!- CATALYTIC ACTIVITY: Reduced ferredoxin + NAD(+) = oxidized ferredoxin + NADH.
-!- CORPCION: FAD); requires magnesium.
PIR, A44897; A44897.
                                                                                                                                                                                                                                                                                                                                                                                                               .

Planta 201:261-272 (1997).
-!- FUNCTION: May be involved in the regulation of photosystem II.
-!- SUBCELDULAR LOCATION: Chloroplast thylakoid membrane; associated with the photosystem II complex.
-!- INDUCTION: By light.
-!- SIMLARITY: Belongs to the psbP family.

-! FUNCTION: Induces smooth muscle contraction.
-! SUBCELLULAR LOCATION: Secreted; wasp venom reservoirs.
-! SIMILARIN: Belongs to the bradykinin family.
-! SIMILARIN: Belongs to the bradykinin family.
-! SAGVENIN: Vasodilator; Pyrrolidone carboxylic acid.

Sequence 10 AA;

diathesis

```
(CDR3) of an antibody having anti-Pactor IX (FIX) or anti-activated Factor IX (FIXa) activity. Such antibodies and their derivatives (including those that comprise the present CDR3 peptide) have Factor VIII offactor activity or FIXa activating activity.

Administration of the antibodies or their derivatives leads to an increase in the procoagulant activity of FIXa, even in the presence of FVIII a inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic diathesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New factor IX/factor IXa antibodies and their derivatives useful for increasing amidolytic activity of factor IXa, and for treating blood coagulation disorders such as hemophilia A and hemorrhagic diathesis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is as reported by Capra et al. [{Proc. Natl. Acad. Sci. USA, 71:4032 (1974); and Proc. Natl. Acad. Sci. USA, 78: 3699 (1991)]. PSL3 means as follows: 'P' designates that the code named material is a synthetic peptide, the second letter designates the corresp. parent protein (Sie 88-99); the third letter designates the light (L) chain; the mineral designates the Drok the idiotypic antigenic determinant of the Igh. Theumatoid factor. See also AAR15365-74 and AAR15375. (Updated on 25-MAR-2003 to correct PA field.)

RESULT

The present sequence is that of complementarity determining region 3 (CDR3) of the heavy chain of an antibody expressed by mouse hybridoma 193/AD3. This antibody has anti-Factor (FIX) or anti-activated Factor IX (FIXa) activity. It is an example of anti-FIX/FIXa antibodies of the invention. Such antibodies and their derivatives (including those that comprise the present CDR3 peptide) have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity. Administration of the antibodies or FIXa, even in the presence of FVIIIa inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitors patients. The antibodies or their derivatives are used in a claimed pharmaceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic

The invention relates to an antibody or its antigen binding fragment (AF) that specifically binds to a plurality of beta-chemokines, particularly monocyte chamchactic proteins MCP-1, MCP-2 and MCP-3. The antibodies are useful in an immunosesay method for detecting the presence of a betachemokine in a sample, and for blocking chemotaxis. The antibodies or their AFs are useful for treating a subject suffering from a disorder chosen from glomerulomephritis, scleroderma, multiple sclerosis, lupus nephritis, cirrhosis atherosclerosis, inflammatory bowel disease or chosen from glomerulomephritis, scleroderma, multiple sclerosis, lupus nephritis, cirrhosis, atherosclerosis, inflammatory bowel disease or chosen; Cachesia, stroke, ulcerative colitis, coronary restences, Huntington's disease and Parkinson's disease. Sequences ABRC1866-68 represent murine monoclomal antibody (MAD) 1A1 heavy chain variable region CDR1-3 (complementarity determining region) fragments
                                                                                                                                                                                                                                                                                                                                                                                                  Novel antibody or its antigen binding fragment that specifically binds to monocyte chemotactic protein-2 and other beta-chemokine, useful for detecting presence of beta-chemokine in sample, and blocking chemotaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "forms a lanthionine bridge"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAY66771-958 represent peptides from the various Vbeta chains of T cell antigen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T-cell antigen receptor V-beta chain CDR3 region sequences accumulated in synovial membranes of rheumatoid arthritis patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antibody; beta-chemokine; monocyte chemotactic protein; MCP-1; MCP-2; MCP-3; antiinflammatory; nephrotrophic; dermatological; hepatotrophic; neuroprotective; antiatherosclerotic; antirheumatic; antiathritic; cytostatic; anticonvulsant; antidiabetic; ophrhalmological; vactoropic; immunomodulator; cerebroprotective; antiulcer; antiparkinsonian; Mab; monoclonal antibody; 1Al; complementarity determining region; CDR.

The sequences represent synthetic lanthionine bridged peptides. The peptides of the invention all comprise a lanthinonine bridge, a thioether bond also called a monosulphide bridge. The peptides can be used as pharmacologically active agents, for example, as hormones, as neurotoxins and as plant regulating agents. The sequences have a higher biological activity than their corresponding naturally occurring peptides. This sequence represents a lanthionine-vasopressin peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel lanthionine-bridged biologically active peptides e.g. vasopressin, somatostatin or enkephalin, useful as pharmaceutically active compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to lanthionine bridged peptides which are analogues of peptide compounds comprising a disulphide bridge. The disulphide bridge is replaced by monosulphide bridge or thiocther bond, designated a lanthionine bridge. Such analogues or lanthionine bridged peptides have improved biological activity compared to the original peptides compounds e.g. vasopressin, somatostatin, enkephalin, and endothelin. The lanthionine-bridged peptides are useful as pharmaceutically active compounds. ABUG1701-ABUG1724 represent lanthionine bridged peptides
                                                                                                                                                                                                                                                                                                                                                                                                                   Lanthionine bridged peptide; monosulphide bridge; thioether bond; improved biological activity; vasopressin; somatostatin; enkephalin; endothelin; pharmaceutically active compound.

Antiviral compsn. against human immunodeficiency virus - contg. specified polypeptide and HIV reverse transcriptase inhibitor or HIV protease inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A novel medicinal composition, comprising the present peptide and a human immunodeficiency virus (HIV) reverse transcriptase or procease inhibitor, can be used as an antiviral drug. The composition is highly active against HIV, and can be administered over a long period. The dose of HIV enzyme inhibitor can be reduced, because combined use with the present peptide synergistically enhances its antiviral activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Reverse-transcriptase inhibitor; HIV protease inhibitor;
HIV surface protein gp120; cell surface protein CD4; treatment, AIDS;
AIDS-associated syndrome.
                                                                                                                                       Human immunodeficiency virus; HIV; reverse transcriptase; protease; inhibitor; antiviral; synergistic enhancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 32; DB 2; Length 16; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The polypeptide has an ability to bind endotoxins, an antibacterial activity and an activity to haemolyse endotoxin-sensitised haemocytes. It also has antivital activity, specifically anti-HIV activity. It exhibits higher anti-HIV activity than known related high endotoxin affinity polypeptides, e.g. Tachyplesins I, II or III or Polyphemusins I or II. It may be prepd. by solid phase synthesis or recombinant DNA techniques. Opp. the Cys residues at postions 2 and 15 are linked through a disulphide linkage as are the Cys residues at positions 6 and 11. See also AAR28775-R28759 and AAR28804. The sequences represent synthetic lanthionine bridged peptides. The peptides of the invention all comprise a lanthionine bridge, a thicether bond also called a monosulphide bridge. The peptides can be used as pharmacologically active agents, for example, as hormones, as neurotoxins and as plant regulating agents. The sequences have a higher biological activity than their corresponding naturally occurring peptides. This sequence represents a lanthionine-oxytocin peptide
                                The present invention describes lanthionine bridged peptide compounds (1). (1) Have improved biological activity compared to the corresponding linear peptide. The present sequence represents a peptide given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to lanthionine bridged peptides which are analogues of peptide compounds comprising a disulphide bridge. The disulphide bridge is replaced by monosulphide bridge or thioether bond, designated a lanthionine bridge. Such analogues or lanthionine bridge peptides have improved biological activity compared to the original peptides compounds e.g. vaeopressin, somatostatin, enkephalin, and endothelin. The lanthionine-bridged peptides are useful as pharmaceutically active compounds. ABU61701-ABU61724 represent lanthionine bridged peptides

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides canoding different immunoglobulin binding protein (198P) polypeptides concoling different immunoglobulin binding protein (198P) polypeptides that specifically bind to a ligand or form one or more disulphide bonds with polypeptides in transferded cells, to generate an 198P that binds to a ramsformed plant cells are selected, and preparing an 198P carray in plant cells. At least one peptide sequence has at least 75% sequence identity to a framework region (FR) of a native 19M, 19G, 19A, 19D, 19E, 19Y, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (GHBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The CHBP is useful for discovery of e.g. screening assays of 19BPs having desired characteristics. The present sequence is a mammalian immunoglobulin cerived peptide that may be incorporated into an 19BP of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Sequence 52, Application US/09828708

Patent No. US2002046753A1

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Ditzel, H.
APPLICANT: Burton, D.
APPLICANT: Schaller, M.
APPLICANT: Burton, D.
APPLICANT: WWENTION: Auto-immune disease
FILE REFERENCE: 1361.005U31
CURRENT APPLICATION WUMBER: US/09/828,708
CURRENT FILING DATE: 2001-09-24

NUMBER OF SEQ ID NOS: 123

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 52

LENGTH: 9
APPLICANT: CHARLERAY
APPLICANT: CHARLELE, GERRA
APPLICANT: CHARLELE, GERRA
APPLICANT: GRANUCHELLE, GERRA
APPLICANT: GRANUR, CHRISTIAN
APPLICANT: GRANUR, CLAUDE
APPLICANT: GRANUE, CLAUDE
APPLICANT: DANIEL
APPLICANT: PAU, BERNARC
APPLICANT: PAU, BERNARC
ITLE OF INVENTION: CDR-H1-DERIVED PETIDE CB11, PHARMACEUTICAL COMPOSITIONS
ITLE OF INVENTION: MADE THEREFROM AND METHODS OF TREATING DISORDERS IN
ITLE OF INVENTION: MADE THEREFROM AND METHODS OF TREATING DISORDERS IN
ITLE OF INVENTION: MADE THEREFROM AND METHODS OF TREATING DISORDERS IN
ITLE OF INVENTION: MADER: US/10/322,142
CURRENT PEDLICATION NUMBER: 00/341,349
PRIOR FILING DATE: 2002-04-23
NUMBER OF SEQ ID NOS: 32
